

RIM

Attenuverter

Bring balance to your system with Rim, a compact 4HP utility module featuring precise signal attenuation, inversion. Dedicated + and - LEDs provide instant visual feedback on voltage polarity, while the top channel doubles as a stand-alone -5V to +5V reference generator when unpatched.

Turn the potentiometer clockwise to scale your signal up, or counterclockwise to flip it upside down and invert it.

Input the signal that you want to process.

The top channel is normalled to an internal reference, transforming it into a steady -5V to +5V manual offset generator when no input is patched.

Dedicated + and - LEDs light up to give you instant, real-time visual feedback on the polarity and strength of your voltage.
